

fasciotens® Hernia

elevated by fasciotens® Carrier

Quick Guide

fasciotens
ABDOMINAL WALL SOLUTIONS

Preparation of the patient

Stitch the sutures (polyfil USP 2 > 50 cm) as a U-suture (2-3 cm wide) with a distance of 1 cm to the fascial edge.

Protect the abdominal organs with moist abdominal drapes during the traction phase.

Option: For easier handling, you can cross the sutures before tensing.

Assembling fasciotens® Carrier

Attaching fasciotens®Hernia to the fasciotens®Carrier

Hold down the push button when opening.

Tightening the traction sutures under pre-tension

Press down the screw head to create a pre-tension of 14 kg. Hold the tension until ALL the individual sutures are tensioned and then slowly release the pre-tension.

The individual sutures should be retightened every 2 min. If the individual sutures cannot be tightened any more, the tensile force can be increased further by turning the screw head.

Always clamp the sutures in the frame from the outside to the inside.

Please note the instructions for use!
